Pará de Minas, Minas Gerais, Brazil · remote (UTC-3)
Open to international contracts, B2B contractor work, or full-time employment in Brazil (CLT)

I build LLM, agent and RAG systems and ship them to production, from architecture to infrastructure, with TypeScript, Python, Cloudflare and AWS. **7+ years in software development**. AI in production: a support agent with evals, guardrails and human review (eval cases passing from 10 to 23 of 31, same model), LLM credit assessments at ~R$0.01 each, face recognition for a city's schools, AI clinical notes in a SaaS used by ~20 clinics and a clinical RAG chat. Agent-first workflow: I set the architecture and acceptance criteria, direct coding agents, then review, debug and own what ships.

EXPERIENCE

AI Engineer — Coppay — Oct 2025 – Oct 2026

Digital account and credit fintech · Full-time (CLT) · remote

- **LLM credit assessments, in production:** gpt-oss-120b cross-checks the credit bureau, the Central Bank registry and loan simulations, and returns risk, amount and conditions in a fixed schema, at ~R$0.01 per assessment. Estimated income alone never leads to a rejection: it becomes an approval conditional on proof of income. The analyst decides.
- **App, BFF and back office:** Expo app on the app stores, used by real account holders; a Hono backend-for-frontend (BFF) on Cloudflare Workers integrating the providers Cronos, Asaas and HBI; a Next.js back office with RBAC and an audit log.
- **New Banking-as-a-Service (BaaS) provider:** in Sep 2026, a new BFF on the Asaas BaaS, with one subaccount per customer, running side by side with the legacy one.
- **WhatsApp agent in Python:** I built with Agno + FastAPI a lead agent that routes to 3 specialists, with read-only tools bound to the conversation's context (no IDOR) and human handoff.

`TypeScript · Expo · Hono · Cloudflare Workers · Durable Objects · Postgres · Python · FastAPI`

Software Developer — Softplan — Nov 2022 – Oct 2025

Full-time (CLT) · remote

- Worked on software products for Brazil's Public Prosecutor's Offices (Ministério Público) and government attorney offices (Procuradorias).
- Recognized 10 times in Softplan's Softplayer A+ recognition program.

Software Developer — FAPAM — Nov 2018 – Oct 2021

Full-time (CLT) · hybrid

- Academic portal serving 4,000+ students.

PROJECTS

Tazz — ride-hailing app — 2026 – present

- **New Expo app:** I architected and built from scratch the rider and driver app and its new Workers: in-house auth, a realtime hub on Durable Objects and an API over Postgres. First production builds in Oct 2026, prepared to replace the Flutter app.
- **Built with agents:** I orchestrated coding agents on a ~200-workstream backlog in parallel, each with a proof per acceptance criterion and a cross-provider model review; human gates on database, main and stores.
- **Migration:** the backend ran on ~158 Cloud Functions and hit GCP's fixed 20 vCPU quota in São Paulo with the app live. I ported 100+ of them to 8 Cloudflare Workers in ~47.5 hours, strangler-fig style, with coding agents.
- **Support agent:** in production, with a person reviewing every draft. A risk gate, PII masking, 9 tools with the customer ID set by the server, a guardrail that requires a source for numbers and status, and an LLM-as-judge that only releases false positives, calibrated to 0 false blocks and 0 bypasses on 55 sentences.
- **Evals:** 31 cases (7 adversarial), a zero-unsafe gate and 4 models compared. Same model, new prompt and guardrail: passing cases from 10 to 23 and handoffs from 80.6% to 38.7%. Public demo of the method: github.com/evertonresende/agent-evals-demo.
- **Knowledge base:** 58 curated entries with keyword search and an objective trigger to revisit RAG.
- **Payments:** Pix (Brazil's instant payments) via Asaas, live since Sep 2026, on an isolated double-entry ledger.

Rota Protegida — school face recognition for a city government 2026

- **Product:** IP cameras at school entrances identify students and staff, record attendance and alert guardians over WhatsApp and email. In production since Jul 2026; handed over to the city in Sep 2026.
- **Recognition cascade:** Python on a VPS detects the face and extracts a 512-D embedding (AuraFace); a Hono API on Cloudflare Workers searches Vectorize; in the gray zone, AWS Rekognition breaks the tie, then human review.
- **Decision:** I tested a second model (AdaFace) as an ensemble and measured 862 events against the AWS verdict: no matches saved and 45 wrong rejections reinforced. I turned it off.
- **LGPD (Brazil's data protection law):** children's biometrics with mandatory consent, automatic retention per data type, a log of who views photos, and per-school isolation in the vector index.

Maximus — app for anesthesiologists 2026

- **Product:** Expo app and Hono API on Cloudflare Workers, with Supabase and RLS. Live, used by anesthesiologists.
- **Clinical RAG chat:** Responses API (gpt-5.4) with file_search over an OpenAI vector store, code interpreter for charts, streaming, and questions by text, image or voice (gpt-4o-transcribe).
- **Board-exam questions:** practice questions for Brazil's anesthesiology board exam (TSA), generated from the vector knowledge base with structured output and validation.
- **Decision:** I built manual RAG (a gpt-5-nano classifier + vector search), then switched to native file_search, because the classifier was blocking legitimate searches.

`TypeScript · Expo · Hono · Workers · Supabase · OpenAI Responses API`

Dental Smart — SaaS for dental clinics 2025 – present

- **Multi-tenant:** SaaS in Next.js and Supabase, with RLS isolation in Postgres (one tenant per clinic). ~20 active clinics, zero churn.
- **AI clinical notes, in production since Feb 2026:** the dentist records the visit, Whisper transcribes it and Llama 3.3 70B writes a 4-section note straight into the patient record, for the dentist to review.
- **Integrations:** WhatsApp message queue with LLM-generated variations, NFS-e service invoices via Focus NFe and contract signing over WhatsApp. CI on GitHub Actions and database backups to R2.

`Next.js · React · Supabase · Postgres RLS · Edge Functions · Groq`

Davions — gallery SaaS for photographers 2026 – present

- **Re-platforming:** re-hosted and refactored the app (originally built in Lovable, an AI app builder) onto 10 Cloudflare Workers with Supabase and RLS. Delivered in Oct 2026.
- **Payments:** I architected escrow on Asaas (a Brazilian payment provider), with an SQL ledger and Pix payouts.
- **AI:** I moved the app's 10 AI functions onto Workers, through Cloudflare AI Gateway.

`TypeScript · React · Cloudflare Workers · R2 · Supabase RLS · Asaas · Stripe Connect`

SKILLS

AI:	LLMs (OpenAI, Anthropic/Claude, Groq, Workers AI), agents and tool calling, RAG (file_search, vector store), structured output, guardrails, LLM-as-judge, evals, speech-to-text, face recognition (AuraFace, AWS Rekognition)
Programming languages:	TypeScript, Python, SQL
Cloudflare:	Workers, Durable Objects, Queues, D1, R2, Vectorize, AI Gateway, Workers AI
AWS (earlier projects):	EC2, ELB, Lightsail, Lambda, SQS, S3, Aurora, Rekognition
Backend and data:	Hono, FastAPI, Node.js, Postgres, Supabase (RLS, Edge Functions), Docker, CI (GitHub Actions)
Frontend and mobile:	React, Next.js, React Native / Expo
Payments:	Pix, Asaas, Stripe Connect, double-entry ledger

EDUCATION

Information Systems, undergraduate studies (incomplete) · FAPAM · Nov 2018 – Dec 2020

LANGUAGES

Portuguese (native) · English (comfortable in technical interviews)
